Potential duplication reduction

when refactoring top-5% clones

Software Maintenance: Over 80% of the total software life-cycle costs. Code Reuse: Proven to reduce costs in the industry with 20-40%. Code Clones: Between 5 - 35% of a typical code base. Low Hanging Fruit: 15 - 40% of duplication caused by 5% of clones.

The Tool: SolidSDD

Finds structural clones:

- Supports C, C++, C# and Java.
- Shows clones vs structure (directories or syntax).
- Computes cloned code %, number of distinct clones, presence of identifier renaming.
- Detection configurable by clone length, identifier renaming, gap size, whitespace/comments.

Implements "overview first, zoom and filter, then details-on-demand":

- Bundled graphs show clones vs system structure.
- Table lenses show clone and file metrics.
- Annotated text shows clones in file context and allows navigating between all pairs.
- Views are linked, allowing navigation between text, clones, and system structure.

Helps to answer questions such as:

- How are clones *distributed* vs system structure?
- Which subsystems have high clone percentages?
- Which files are affected by a given clone?
- How much duplication relates to the top x% clones?

Structure View

1. Radial tree

Shows system hierarchy (folders, files); Open/collapse subsystems by double-clicking.

- 2. Hierarchical Edge Bundling Aggregate clone relations atop of system structure; Supports finding subsystems linked by clones.
- 3. Color-mapping Nodes show cloned code % in a file/folder; Edges show cloned code % between the file-pair.

- 4. Linked views Select file/clone in a view to highlight it in others.
- 5. File detail view

File & Clone Details Views

Metrics Views

- 8. Color-coded text
- Cloned code in (un)selected file-pair, renamed identifiers. 9. Synchronized scrolling
- Easily compare matching code fragments (6a, 6b)
- 10. Clone detail view All clones with number of instances, fan-out (num involved files), length, total gap, num renamed identifiers.
- 11. Clone pairs view Files sharing clones with the file selected in (9)

12. Table lens

Files as rows with name, size, clone code %, clone fan-in (num intra-file clones), fan-out (num inter-file clones).

All files with cloned-code percentage, number of clones, and presence of identifier renaming.

6. Clone pairs view

Files sharing clones with the file selected in (5).

7. Code detail view

Cycle through clone-pairs by clicking a code fragment.

13. Table lens controls

When zooming out, table cells are shrunk and text is replaced by colored bars showing metric values.

14. Linked views

Selecting files/clones highlights them in the structure view. Supports investigation of e.g. top 10% largest clones.

Try it yourself!

- Integrated detection and exploration of code clones;
- Free trial and academic licenses;
- Support for **industry-sized** code bases:
- Batch-mode report generation, e.g. CSV and XML;
- Open API and SQLite database: easy to integrate with your own analyses or tools:
- Download, install, start using in under 5 minutes (Windows).
