

# Ambiguity in Requirements Engineering

Alessio Ferrari<sup>1</sup>

<sup>1</sup>ISTI-CNR, Pisa, Italy  
alessio.ferrari@isti.cnr.it

November 30, 2017

- Ambiguity in **written** requirements (a little)
- Ambiguity in requirements elicitation **interviews** (a little more)
- I will not mention ambiguity in other phases (analysis, negotiation)
- Pointers to papers will be provided

(Sorry if you already saw part of the content of this presentation)

## Definition(s) of Ambiguity (from Berry, Kamsties and Krieger, 2003)

- Focus on WRITTEN natural language (NL) requirements
- **Dictionary Definition:** (1) the capability of being understood in two or more possible senses or ways; (2) uncertainty
- **Software Engineering:** There are **two major types** of ambiguities:
  - ▶ Language ambiguities (lexical, syntactic, etc.)
  - ▶ Software engineering ambiguities – depend on the domain involved, require domain knowledge to be identified
- Some authors consider only **expression inadequacy** as source of ambiguity
- Others consider **missing information** as an additional source – people leave out self-evident facts
- Ambiguity is related to **incompleteness**

“ambiguity” is ambiguous!

## Ambiguity in RE (from Berry, Kamsties and Krieger, 2003)

Property of an expression of being interpreted in multiple ways

- **Vagueness:** the sentence admits borderline cases (e.g., *Avoid **long** C functions*)
- **Generality:** the sentence/term needs to be specified more (e.g., *The **interface** shall be coded in Java*)
- **Lexical ambiguity:** term has different unrelated vocabulary meanings (e.g., ***bank***)
- **Syntactic ambiguity:** sentence has more than one syntax tree (e.g., *Structured approaches **and** tools*)
- **Semantic ambiguity:** sentence can be translated into more than one logic expression (e.g., ***All** lights have **a** switch*)

**Pragmatic ambiguity:** the meaning depends on the context – other sentences, domain knowledge, common-sense, viewpoint

## Pragmatic Ambiguity (RE'12, AIRE'14)

There is a  
**MOLE**  
at **WORK**

mh...

## Towards Ambiguity in Interviews (RE'15)

- Several automated procedures for other types of ambiguity (QuARS, ARM, SREE, etc.)
- We wanted to study pragmatic ambiguities, but **we needed data**
- With **Paola Spoletini**, we started to perform **interviews**, to get the data we needed
- We performed 34 unstructured interviews
- We annotated all the cases that the analyst perceived as ambiguous (232)
- It became clear that a **new classification** was needed

## Example: Fitness Tamagochi

Customer

You can decide what type of character you want to **create**

So you can **choose** the character?

Actually, you cannot. You can possibly **become** a specific character

Requirements Analyst

Tamagochi does not let you choose the character

# Example: Train Protection System

**Customer**

I want the train to stop within 50 meters if a red signal is passed

It may not be possible if you go at 130 km/h

I meant, in shunting mode [max: 30 km/h]

Trains going at full speed need hundreds of meters to stop

**Requirements Analyst**

Ambiguity seemed to be connected to  
**incompleteness** and **inconsistency**!

# Definition of Ambiguity

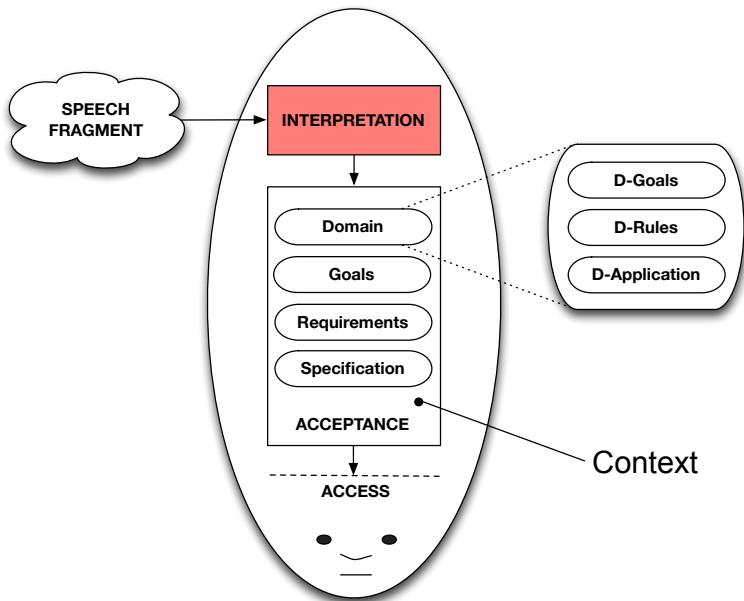

## Ambiguity in Interviews

An ambiguity occurs in a requirements elicitation interview when a customer **articulates a unit of information**, and the meaning assigned by the requirements analyst to this articulation **differs** from the meaning intended by the customer.

- **Unit of information:** system need or domain-related aspect
- **Articulation:** any speech fragment
- **Meaning:** **contextual** meaning

We include cases in which the analyst cannot give any interpretation

# The Context of the Analyst (REJ'16)

## Ambiguity Types: Correct Disambiguation

## Ambiguity Types: Correct Disambiguation

- What I hear has an interpretation
- The interpretation matches with the one intended by the customer
- The interpretation is **consistent** with the context
- The interpretation appears sufficiently **complete**

## Ambiguity Types: Interpretation Unclearity

## Ambiguity Types: Acceptance Uncertainty (Train)

## Ambiguity Types: Detected Incorrect Disambiguation (Tamagochi)

## Ambiguity Types: Undetected Incorrect Disambiguation

## Ambiguity Types: Multiple Understanding

## Which are the Triggers? (RE'16)

- **Under-specified terms (U):** people, knowledge, movement, area, rule, data, category, interface, thing, detail
  - ▶ *“The **interface** shall be coded in Java”*
- **Vague terms (V):** minimal, as much as possible, later, taking into account, based on, appropriate
  - ▶ *“The loading time shall be **minimal**”*
- **Pronouns (P):** he, she, it, this, those, which, that
  - ▶ *“The system sends a message to the receiver, and **it** sends an acknowledge message”*
- **Quantifiers (Q):** all, for each, many, some, both
  - ▶ *“**All** lights have **a** switch”*
- **Domain-specific terms (D-S):** connoisseurship method, herpes zoster, systemic disease, Program

## Same Category of Trigger, but Different Ambiguity Type

### Example 1 - Under-specified Term → Multiple Understanding

- Mobile application that monitors the use of the mobile phone
- **Example:** *"Maybe the system could give me also some recommendations"*
- Interpretations: **positive** (this app could be useful to you) or **negative** recommendations (do not use this app)

## Same Category of Trigger, but Different Ambiguity Type

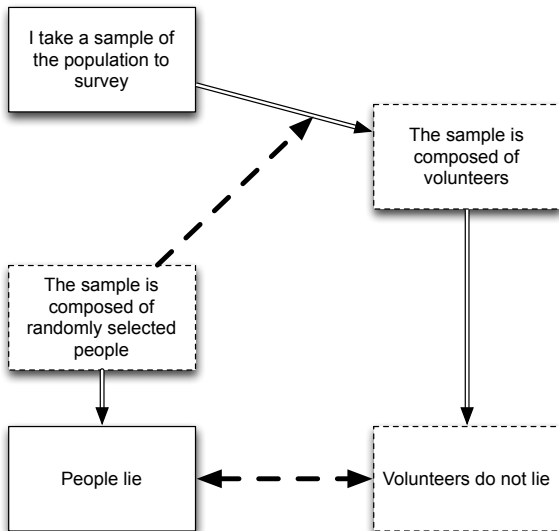

### Example 2 - Under-specified Term → Undetected Incorrect Disambiguation

- A system to monitor the diet of patients for research purposes
- **Example:** “We analyse a representative sample of the population”
- representative sample == **volunteers** (Undetected incorrect disambiguation)
- “People tell lies about their diet” (Acceptance unclarity)
- representative sample == **randomly selected people**

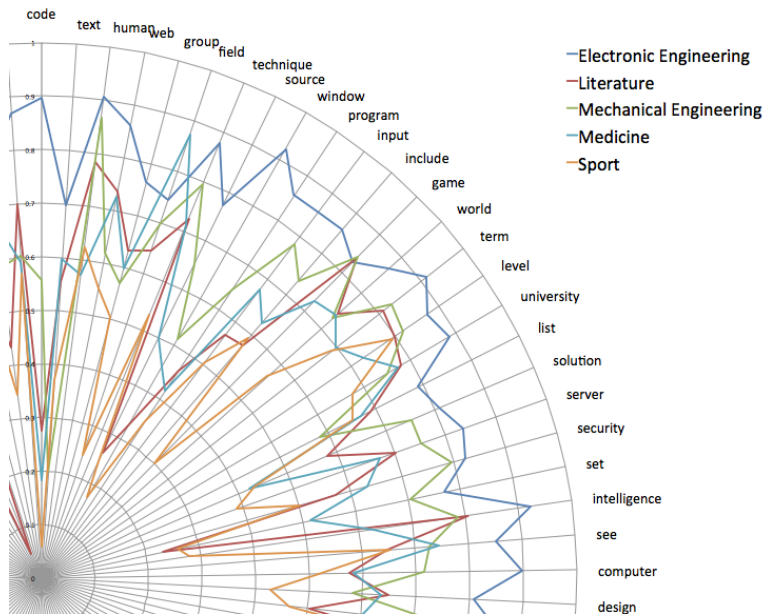

## Observations

- The majority of ambiguity cases were due to **under-specified** terms and by **fragments**
- Example: *“I want the train to stop within 15 meters if a red signal is passed”*; *“I can go and ask for a product”* (go WHERE?)
- Current research concerning triggers in NL requirements accounts for about **10%** of the ambiguity cases in interviews (pronouns, quantifiers and vague terms)
- The remaining **90% of the cases** (under-specified, domain-specific and fragments) require **further research**

## Current Research: Using Argumentation (RE'17)

# Current Research: Domain-specific Ambiguity (AIRE'17)
